BEACON

Error-free filing... *before* you submit to the regulator

Did you know, even "correct" XBRL filings can still have *incorrect data*?

Taxonomies use advanced validation rules to check you've entered the right kinds of information... but they can't check the data itself. Think of it as remembering to enter a figure for net profit, but never knowing if a few zeros got lost (or added) by mistake.

So why can't you check the data before sending it? When you create a filing, your data is *encoded* in XBRL. The information is all there in one file – just not in a format that you can view. That means when the time comes for submission, **you never actually see what you're sending to the regulator**. And that's where data errors can slip through.

The solution? See it like a regulator.

Beacon, from CoreFiling, solves this challenge. Beacon is a powerful XBRL review framework. It lets you view your filing *inside the regulatory templates* – with Beacon, you can see your data exactly as the regulator will, and check it for errors *before* you submit anything to the gateway.

And since Beacon is hosted in the cloud, you can collaborate with colleagues around the world, in real time. No performance losses, no complicated installations. **Guard against rejections, and keep your data consistent, with Beacon.**

ABOUT COREFILING

We are one of Europe's leading XML vendors, with a substantial history in the successful design, publication and validation of XML and XBRL. Our success is based on tools and services created with an uncompromising commitment to engineering excellence. The company is an active member of the XBRL Consortium, which oversees the development of the XBRL standard.

Put your data under the microscope.

Beacon gives you unprecedented access to the information locked inside your XBRL documents. Drill down into to the raw data, apply targeted validation rules, and inspect each filing for errors with incredible accuracy.

Collaborate and review.

Beacon fits seamlessly into your existing workflow. Its advanced cloud architecture promotes true collaboration: an *unlimited number of users* can access Beacon through web browsers. Beacon also includes a powerful filing management system – keep all your filings together in a secure, change-tracked environment, ready for review.

Our cloud or yours?

Security for your data is paramount. That's why Beacon is ISO27001 certified, and CREST approved. And if you don't want your information stored remotely? No problem. Beacon lets you set up your own private cloud on a local server. In fact, **Beacon supports SaaS delivery, your own private cloud, or a traditional on-premises installation.**

Always up to date.

Beacon is "taxonomy agnostic". That means you don't have to keep track of the taxonomies that are most relevant to you. Our platform responds immediately to new reporting requirements, as soon as they are published (whether from the EBA, EIOPA, or NCAs). No complicated software updates, and no lengthy configuration.

API Integration & Automation.

REST APIs let you connect to *any* Beacon feature. Access your existing data sets. Interrogate regulatory tables. Extract data for true last mile assurance.
